IN THE SPECIFICATION

Please replace the paragraph on page 6, lines 14-31 with the following 1-7
7 lines 28-32 page 8 lines 1-7
paragraph.

Returning to FIG. 1, the temporary storage 112 is coupled to the high resolution compressor 118, the low resolution compressor 120, and the A/V database 124. The digital AV signals are recalled from storage 112 and compressed by each compressor 118 and 120. For example, the low resolution compressor 120 may process the uncompressed video into a standard compression format such as the MPEG (Moving Pictures Experts Group) standard. The low resolution compressed image sequence is stored in the database as LOW RES 128. The high resolution compressor 118 may, for example, compress the AV signal into a format that is DVD compatible. The high resolution compressed images may be stored in the database as HIGH RES 126 or maybe coupled directly to the DVD authoring tool for storage on a DVD without storing the high resolution video in the database 124. The invention may also retrieve the digital video signals from storage 124 112 and couple those signals, without compression, to the AV database 124 for storage as uncompressed video 132. As such, the database 124 can be accessed to recall high resolution compressed digital video signals, low resolution compressed digital video signals, and uncompressed digital video signals.
